

Capacity Building

Self-sufficiency

At Bestnet we are very aware of the fact that to be successful, transfer of technology requires more than just the moving of high tech equipment to or within the developing world.

We are in the midst of transferring our production to DRC, Ghana, Kenya and Nigeria. We work in close interaction with our local partners in the respective countries and by sharing our know-how and expertise with regard to the production and quality control of Netprotect®, we enable them to find the perfect location to erect a production plant, purchase the necessary machinery and equipment and implement our production process.

As such, our local partners can in time be self-sufficient, whilst producing nets **in Africa by Africans for Africans**.

Responsibility

Furthermore, we focus on making sure that our agents, suppliers and distributors receive the necessary knowledge, management skills and technical and maintenance capabilities, in view of the fact that it is them, that have to be able to implement the technology in question.

We encourage the adoption and use of environmentally sound and fully sustainable technologies, whilst requiring from our agents, suppliers and distributors both voluntary approaches and a regulatory framework that nurtures innovation and economic, social and environmental accountability, all of which by providing them with the necessary know-how, goods and services, equipment and organizational and managerial procedures.

Environmental protection

Bestnet strives towards implementing technologies, which protect the environment, are less polluting, and which recycle more of their wastes and products.

As such, we create jobs on a large scale and indirectly generate a money flow in the developing countries which in turn creates growth.
